PROFESSIONAL SUMMARY

B.Tech Information Technology graduate specializing in Python-based automation and Application Security. Builds practical, automation-first tools that solve real operational problems — from full-stack systems processing 700+ records to hands-on vulnerability assessments using industry-standard security tools. Interested in designing backend systems and workflow automation that improve operational efficiency. Strong foundation in Python, Flask, React, and AI API integration, with a growing focus on cybersecurity and application security engineering.

TECHNICAL SKILLS

Backend: Python, Flask, REST API Integration, Pandas
Frontend: JavaScript, React, HTML5, CSS3
Security: SHA-256, Password Hashing, Nmap, Nikto, Web Security Fundamentals
AI & Automation: Google Gemini API, Prompt Engineering
Libraries: Pandas, PDFPlumber, ReportLab
Developer Tools: Git, GitHub, Linux, VS Code

PROJECTS

Exam Seating Allocation System (ESA)

Python | Flask | React | Pandas | PDFPlumber | ReportLab

- Built a full-stack exam seating allocation system to automate a manual process prone to errors and delays for college examination cells.
- Automated seating allocation workflows for both university and internal examinations.
- Migrated the project from a Flask-only interface to a React frontend with a Flask backend.
- Generated seven different administrative reports in PDF, Excel, and Word formats.
- Designed configurable allocation workflows to support changing examination requirements.
- Successfully validated the application using datasets containing more than 700 student records.
- Packaged the application as a Windows executable for practical deployment.

Prathi Agent – AI-Assisted Job Application Automation (Prototype)

Python | Flask | React | Gemini API

- Developed a prototype AI-assisted job application automation system.
- Integrated Gemini API to generate job-specific email content from job descriptions.
- Implemented AI-assisted resume customization based on uploaded resumes and job descriptions.
- Explored automated email workflows for sending resumes to recruiter email addresses.
- Gained practical experience integrating AI APIs, prompt engineering, and frontend-backend communication.
- Project is currently under development due to external API permission and approval requirements.

Secure Authentication System

Python | SHA-256

- Developed a command-line authentication system supporting user registration and login.
- Implemented password hashing using SHA-256 with randomly generated salts.
- Designed a secure credential verification workflow without storing plaintext passwords.
- Explored authentication fundamentals including hashing, salting, and password verification.

Live Domain Security Assessment

Kali Linux | Nmap | Nikto

- Performed a security assessment on a personally owned web domain using Nmap and Nikto.
- Conducted port scanning, service enumeration, and web server security checks.
- Analyzed scan results to understand exposed services and common web server security issues.
- Documented findings to strengthen practical knowledge of vulnerability assessment tools.

EDUCATION

Bachelor of Technology (Information Technology)

PSN Engineering College, Anna University | Graduated: May 2026

LANGUAGES

Tamil (Native), English (Professional Working Proficiency)
